Figure 8. Raven Rock command center exact-object evidence

One of 79 target-valid Wave 2 captures; every registered building now has an exact screenshot.

World Redevelopment Wave 2

Program ID: REDEV-2026-07-28-R2

State: **ACCEPTED — LIVE TRANSACTION AND POST-RELEASE QA PASS**

Supersedes: no prior release; R1 remains accepted and immutable.

Objective

Wave 2 continues the work deliberately left outside the first atomic release:

- 1. apply the Raven Rock tunnel standard beyond the S1 pilot;
- 2. repair a larger stair/landing/decision-node sequence without weakening production movement or mining safeguards;
- 3. close the C01 recessed-portal floor-plan gap;
- 4. materially increase exact-object screenshot coverage;
- 5. select and build the next highest-impact MainStreet spacing, road, wayfinding, or destination-integration package.

This wave begins from measured post-R1 conditions. It does not replay or amend R1 operations.

The PM baseline, live hold, database/media starting counts, and release-state definitions are recorded in [baseline-and-release-readiness.md](#). Rejected physical alternatives, failed camera evidence, and the stricter neighbor-state decision are retained in [decision-and-rejection-log.md](#). The complete live and post-state result is recorded in [as-built-release-report.md](#), with the independent post decision in [post-release-independent-acceptance.md](#).

Immutable engineering baseline

Field	Value
Saved-world directory	data/worldsnap-wave2-baseline-4fca1ff3-20260728/region
SHA-256	4fca1ff3c40ae9c24c9338483b0780678aa5966bb570a642f0d0277885331a2b
Region files	26
Bytes	122,744,700
Hash algorithm	SHA-256 over sorted filename + NUL + bytes + NUL
Captured	2026-07-28 after save-all flush

`data/worldsnap/region` is mutable and must not be named as the Wave 2 design baseline. A separate same-moment pre-release snapshot will still be required immediately before any live execution.

Workstreams

Workstream	Scope	Required output	Live authority
R2-INF-RR	Remaining Raven Rock tunnel leg, junction, and stair defects	inventory, selected package, forward/rollback, database features, cameras, tests, route schedule	INF-RR-02 committed and accepted
R2-MSA	Remaining MainStreet spacing/road/corner/destination problem	measured alternatives, selected non-overlapping package, guarded ops, database/media contract, tests	R08 committed and accepted
R2-MEDIA	C01 portal plan plus exact-object building/circulation captures	floor-plan artifact, camera manifests, images, hashes, media relations, coverage delta	79/79 media QA PASS
R2-PM-QA	Dependencies, overlap, evidence, release/rollback	traceability, target intersection report, risk/decision logs, atomic controller, post-QA	Final post verifier PASS

Selection rules

Tunnel package

The next package should be the largest coherent segment that can be understood and rolled back as one unit, not the largest possible volume. Priority order:

1. the measured T2b route-identity defect;
2. a complete RR-Z5 stair flight/landing sequence if it can be isolated;
3. one T2/T3 decision node with advance and confirmation signage;
4. only then, longer primary-spine rollout.

T2b should read as a five-wide tunnel within a natural cavern. It must not fill the full cave. Selected windows are intentional; accidental openings, route dissolution, variable tread/headroom, and arbitrary light placement are not.

MainStreet package

Selection must prove a remaining defect on the Wave 2 snapshot. Preference:

1. a route that terminates ambiguously or at an unfinished edge;
2. a decision corner where the next destination cannot be read;

3. an unresolved C01 arena/stadium-finding sequence;
4. a B02/B03 frontage or service relationship not already solved by R1;
5. residual spacing/crowding that can be fixed without relocating protected authored interiors.

No package may overwrite R1 solely to make a visually different version.

Media package

Exact-object coverage is prioritized over raw screenshot count:

1. the new C01 recessed portal floor plan;
2. the 55 buildings without exact perspectives;
3. every new Wave 2 circulation feature;
4. important tunnel nodes and stairs;
5. day/night or context variants only after exact primary relations exist.

Required engineering gates

Every physical candidate must provide:

- immutable baseline hash equality;
- complete source-state properties, not material names alone;
- unique target cells;
- explicit finite alternatives for any neighbor-sensitive state;
- source/desired/rollback bijection;
- block-entity, inventory, fluid, gravity, and support-dependent census;
- database intersection check, including vertical overlap;
- cross-package target intersection check;
- declared operation envelope for live entity clearance;
- cameras captured or frozen before execution;
- generator and independent QA tests;
- dry-run in group-aware strict mode;
- database feature and observation payloads;
- route tests that require both directions and forbid dig/tower.

Live-release gates

Offline acceptance does not authorize live mutation. The release coordinator must additionally require:

1. fleet bots paused and no human player in an operation envelope;
2. no active or queued world-building mission;

3. `save-all flush`;
4. new immutable pre-release snapshot;
5. every forward guard passing that same snapshot;
6. all-package live entity gate immediately before execution;
7. fixed package order with automatic reverse-order compensation;
8. post-flush immutable snapshot;
9. every rollback guard matching installed state;
10. exact census, bidirectional routes, matched post media, database import, atlas/catalog refresh, dossier update, and Sites version.

Final R2 acceptance matrix

Requirement	Current state	Completion evidence
R2 baseline frozen	Complete	directory and SHA above
Tunnel inventory	Complete	10 legs, 15 nodes, 15 RR-Z5 flights in <code>data/world-review/ravenrock-wave2-tunnel-inventory-2026-07-28.json</code>
Tunnel package	Accepted	<code>INF-RR-02</code> ; 151/151 strict live groups; route passes both directions; six matched after cameras
MainStreet defect selection	Complete	missing R06/R07 midblock connection selected as R08
MainStreet package	Accepted	740/740 strict live groups; 736 explicit plus two reactive states; route passes both directions
C01 portal floor plan	Complete	exact 1,600×1,100 plan PNG plus PDF relation
Exact screenshot expansion	Complete	79/79 target-valid unique images; 69/69 buildings exact
Cross-package overlap	PASS	zero cross-package, R1, or protected-feature intersections
Live execution	Committed	<code>data/world-review/redevelopment-wave2-atomic-transaction-2026-07-28.json</code>
Post-release QA	PASS / accepted	887 explicit, two reactive, 887 rollback, four route directions, 14 matched cameras
Database import	PASS	51/51 features; database now 875 features, 23 scans, 1,881 observations
Atlas and dossier	Complete	seven-sheet d05ac782... atlas plus Wave 2 artifact register and master PDF
Sites publication	Separate publication step	must identify the accepted d05ac782... release and 1bd71512... database

Stop-work conditions

Stop before mutation if:

- the same target cell appears in two packages;
- a package intersects a registered room, inventory, fluid, or protected entity not explicitly handled;
- a route fix depends on widening the resident leash or lowering production mining safeguards;
- a camera, map, or plan is assigned a snapshot it was not generated from;
- rollback cannot reconstruct exact prior block properties;
- a finite-state union has zero or multiple matching alternatives;
- any human player or blocking entity remains inside a live operation envelope;
- an apparent aesthetic improvement reduces route legibility, clearance, or destination identity.

Documentation rule

Wave 2 retains failed attempts and rejected alternatives. Reports must distinguish:

- measured condition;
- researched recommendation;
- selected design;
- generated/offline-ready state;
- preflighted state;
- live built state;
- independently verified state;
- published state.

No stage is silently promoted to the next.

Wave 2 As-Built Release Report

Program: REDEV-2026-07-28-R2

Transaction: redevelopment-atomic-release-wave2-2026-07-28

Release date: 2026-07-28 UTC

Record type: coordinated physical, movement, media, and publication handoff

Executive record

Wave 2 installed two bounded improvements without replaying or altering the accepted R1 package set:

1. Raven Rock INF-RR-02, a ten-station dry liner pilot that gives the T2b cavern route a consistent five-wide identity while retaining a deliberate cave window and stopping before the measured wet boundary; and
2. MainStreet America R08, a three-wide, east-west shared cross-link joining ALLEY-W, R01, and ALLEY-E, with controlled fence openings, complete junctions, a crosswalk, lighting, and destination signs.

The fixed-order transaction committed both packages. The post snapshot proves 887 explicit installed cells and two neighbor-reactive fence states. Exact rollback guards match all 887 explicit cells. A non-digging, non-towering walker traversed both route contracts in both directions with no sprint, crouch, jump control, or movement-policy violation. All fourteen fixed cameras were rendered again from the immutable post snapshot and differ from their prerelease partners while retaining the exact camera contract.

The separate media workstream also delivered 79 unique, target-valid images: 55 building perspectives and 24 circulation perspectives. In the Wave 2 catalog, all 69 registered buildings have an exact screenshot and all 69 have an exact floor plan. The C01 recessed public portal plan closes the one remaining building floor-plan gap.

The authoritative machine acceptance record reports PASS, with release decision ACCEPTED:

data/world-review/redevelopment-wave2-post-release-qa-2026-07-28.json

All eight final gates pass. The transaction ledger intentionally retains its historical committed-pending-post-qa status; it is an append-only record of the controller's terminal state at commit time, not the final acceptance report.

Release identities

Engineering baseline

Field	Value
Directory	data/worldsnap-wave2-baseline-4fca1ff3-20260728/region
SHA-256	4fca1ff3c40ae9c24c9338483b0780678aa5966bb570a642f0d0277885331a2b

Bytes	122,744,700
Purpose	design, tunnel inventory, exact-object media

Same-moment prerelease snapshot

Field	Value
Directory	data/worldsnap-wave2-prerelease-b1356bca9fcbdc7a-20260728/region
SHA-256	b1356bca9fcbdc7a90b580b2f9210947788d74716e1a706f5e8f0d0f789dbb27
Region files	26
Bytes	123,279,631
Purpose	exact live guards, final before media, transaction source

Immutable post-release snapshot

Field	Value
Directory	data/worldsnap-wave2-postrelease-d05ac7822795eff0-20260728/region
SHA-256	d05ac7822795eff03340e46695a6f3accbdfdf82d11559d857e17b4d1962999
Region files	26
Bytes	123,313,802
Purpose	installed-state proof, rollback postflight, matched after media, atlas

Each digest uses SHA-256 over sorted `filename + NUL + bytes + NUL`. The directory name is a convenience label; independent tools recompute and compare the digest.

Package accounting

Package	Explicit cells	Guarded commands	Finite unions	Reactive cells	Forward SHA-256	Rollback SHA-256
Raven Rock T2b	151	0	0	0	2ad97a32c2a48b28021edd2dd782acd78e0f07ed42b7d3949a0685bc06fd9690	56df298c3e35d94bb3ccc8abd83ebda8a2b49d5717aca24b9bbaf5a2be97bc61
MainStreet R08	736	4	4	2	d9dea58a3c20ba6e5faca63fbb1ee7cc11857dc51e4956ff27624fee8c3da69f	5836dc47ce987fda6a10f2b00cb43e2a5582f93be215894c20294858274efd71
Total	887	4	4	2	—	—

The combined forward plan has 891 source groups: 887 REPL groups and four guarded sign-NBT command groups. R08 has four complete finite-state unions. Their unselected alternatives are expected no-ops, not drift. The transaction reported four expected alternative no-op commands, zero unexpected no-ops, zero unknown replies, zero failed commands, and zero failed groups.

Package 1: Raven Rock T2b

Existing defect

T2b crossed a natural cavern without a consistent route section. The path could be followed from memory, but its changing edges, sparse lighting, and large open volume made it read as cave space rather than primary circulation. The original planning extent reached x -135; immutable snapshot inspection found active water at x -135/-134, z 177..179, y 1..9. Extending the pilot there would have violated its dry, addition-only contract.

Installed response

The accepted package stops at x -136. It uses 151 exact-air additions across ten stations from x -145..-136. The intervention supplies a consistent polished-deepslate/stone-brick route frame and repeated light rhythm. It does not excavate, displace water, cut a log, replace a gravity block, or close the whole cavern. Twelve water cells remain in the wider buffer; none occupies a target or shares a face with one. The wet terminal is retained as an explicit future design boundary.

Live execution result

Measure	Result
Strict source groups	151
Successful groups	151
Failed groups	0
Commands	151
Successful commands	151
No-op commands	0
WorldEdit leftovers	0
Execution duration	2.411 seconds

Experience result

Route `RR-T2B-W2-BIDIRECTIONAL` joins `(-145,3,187)` and `(-136,2,182)`. The forward and reverse tests each used three measured legs. Both passed. Aggregate leg time was 2.749 seconds forward and 2.668 seconds reverse. Neither direction recorded a movement-policy violation.

The result is a pilot standard, not a claim that every Raven Rock tunnel or RR-Z5 flight is complete. The remaining inventory stays in `data/world-review/ravenrock-wave2-tunnel-inventory-2026-07-28.json` for later, separately guarded phases.

Package 2: MainStreet R08

Existing defect

R06 and R07 had no continuous midblock east-west connection. The two rear alley systems read as disconnected service fragments, and a person turning at the central spine lacked a clear cross-campus option. The missing link reinforced the user's observation that one could turn a corner and lose the spatial story.

Installed response

R08 supplies a three-wide, 354-cell walking surface at y `64`, from the west endpoint `(-57,65,-124)` to the east endpoint `(56,65,-124)`. Its 736 explicit cells include the surface, gate work, junction treatment, lighting, and wayfinding support. Four guarded NBT writes author the approved signs after their sign blocks exist.

The package does not intersect an accepted R1 target, an active protected building, room, driveway, landscape or garage bound, a protected tree, or an existing target block entity. It changes two adjacent birch-fence connection properties through normal neighbor updates. Both reactive states were modeled before release, declared in the manifest, observed in the post snapshot, and included in the rollback restoration proof.

Live execution result

Measure	Result
Strict source groups	740
Successful groups	740
Failed groups	0
Expanded commands	744
Successful commands	740
Expected finite-union no-ops	4
Unexpected no-ops	0
WorldEdit leftovers	0
Execution duration	2.850 seconds

All four finite unions selected the exact runtime fence state predicted by the offline simulator. The accepted transaction therefore did not weaken strict mode to accommodate neighbor-sensitive blocks.

Experience result

Route `MSA-R08-WEST-EAST-BIDIRECTIONAL` joins `(-57,65,-124)` and `(56,65,-124)`. Each direction used five route legs. Both passed. Aggregate leg time was 26.390 seconds west-to-east and 26.515 seconds east-to-west. Neither direction recorded a movement-policy violation.

R08 is a circulation repair, not a wholesale move of protected houses or authored interiors. It improves the grid incrementally while retaining the accepted R1 garage, alley, public-realm, bunker, and landscape work.

Atomic release and entity safety

The all-package entity gate passed immediately before execution:

Measure	Result
Packages passed	2 / 2
Entities returned in envelopes	1
Blocking entity hits	0
Required chunks	67
Temporary force-load tiles	2
Missing required chunks	0
Temporary tiles released	2 / 2
Final force-load set restored	Yes

The controller then repeated the entity screen per package. It executed in the manifest order—Raven Rock followed by MainStreet—and was prepared to roll back in reverse order if a report or command failed. Neither package failed, so no compensating rollback was invoked.

The transaction ran from 02:26:23 to 02:26:35 UTC. Both package ledgers report `committed`. The durable transaction record is:

```
data/world-review/redevelopment-wave2-atomic-transaction-2026-07-28.json
```

Post-state and rollback proof

The post verifier reads the immutable d05ac782... copy and does not connect to Minecraft. It requires:

- every one of the 887 explicit desired states;
- both declared reactive fence states;
- all four sign block entities and sixteen authored sign lines;
- all 887 exact rollback source guards;
- a simulated restoration of the complete prerelease state;
- committed transaction order and artifact hashes;
- the combined and repeated package entity gates;
- different pre- and post-snapshot identities.

The physical and rollback portions pass. No post-state mismatch, rollback source mismatch, sign mismatch, or restoration mismatch remains.

The rollback files are disaster-recovery evidence, not a routine replay instruction. Any actual rollback still requires a fresh entity gate, coordination with later world changes, and an atomic transaction of its own.

Matched release media

The release contract contains six Raven Rock cameras and eight MainStreet cameras. Each after report:

- names the immutable d05ac782... post snapshot;
- is bound to the exact camera-manifest SHA-256;
- identifies one exact primary feature per camera;
- points to a current PNG whose bytes match the recorded SHA-256;
- uses the same camera parameters as the prerelease partner; and
- proves that the after image differs from the before image.

Package	Cameras	Current images	Same-camera	Changed from before	Result
Raven Rock	6	6	6	6	PASS
MainStreet R08	8	8	8	8	PASS
Total	14	14	14	14	PASS

The MainStreet team retained an earlier disagreeing capture record as `rejected-stale-capture-report-7635f0.json`. It is explicitly rejected and is not silently counted as accepted evidence.

Exact-object media and floor plans

The wider media release is deliberately separate from the 14 matched construction cameras. It contains 79 unique images against the 4fca1ff3... engineering/media baseline:

Measure	Result
Manifest captures	79
Unique camera definitions	79
Unique output paths	79
Unique image hashes	79
Aim points inside target bounds	79
Images passing visual metrics	79
Exact Wave 2 catalog links	79
Building perspectives	55
Circulation perspectives	24

The catalog result is:

Coverage measure	Result
Registered buildings	69
Buildings with exact screenshot	69
Buildings with exact floor plan	69
Remaining building screenshot queue	0
Remaining building floor-plan queue	0

The C01 recessed public portal supplement is both PNG and PDF. Its plan PNG is 1,600×1,100, 226,044 bytes, and has SHA-256 `8023bb700bf60b10f2a1747b4e28a42ee65614f10a10ec025feb3cd3195e0e45`.

This closes building-level media coverage. It does not imply that all rooms, minor custom features, districts, or infrastructure relations have individual screenshots. Those feature-level items remain a legitimate future media queue.

Database import and final acceptance

The database import was deliberately sequenced after the physical, rollback, route, and matched-media gates. Before mutation, the importer copied `data/world-map.db` to: `data/backups/world-map-wave2-preimport-20260728T024110Z.db`

The 2,256,896-byte backup has SHA-256 `a9af19a2823464a6a190f53283ae4d0215e49d44a6481a3b2fe0a80b455cef06`, passes SQLite integrity checking, and has zero foreign-key violations.

The import added 41 Raven Rock and ten MainStreet records, two scans, and 51 observations:

Database measure	Before	After	Delta
Features	824	875	+51
Scans	21	23	+2
Observations	1,830	1,881	+51

Read-only verification found all 51 expected external IDs, all parent relationships, and all evidence payloads. The final database SHA-256 is `1bd71512b9246b67b25a7fff91cd0745eb47d089e66fa15ee7ab23a41b21a503`. Post-import integrity is `ok` with zero foreign-key violations.

The final post verifier therefore reports:

Acceptance measure	Result
Packages	2 / 2
Explicit installed states	887 / 887
Reactive states	2 / 2
Rollback guards	887 / 887
Guarded sign commands	4 / 4
Route contracts	2 / 2
Route directions	4 / 4
Matched after cameras	14 / 14
Database features	51 / 51
Failed gates	0
Decision	ACCEPTED

The import ledger is `data/world-review/redevelopment-wave2-database-import-2026-07-28.json`.

Post-release atlas

The immutable Wave 2 post atlas is:

`data/exports/box/redevelopment-atlas-wave2-post-2026-07-28/team-a`

Sheet	Dimensions	Bytes	Populated ratio	Nonblank
Overall active world	1,792×2,176	1,213,312	0.9997	Yes
Ravensreach core and old town	805×885	108,897	1.0000	Yes
Ravensgate	725×965	73,340	1.0000	Yes
Western approach road	964×324	62,886	1.0000	Yes
Westlight venue and district	900×1,028	128,682	1.0000	Yes
Western project corridor	1,395×1,107	196,877	1.0000	Yes
Raven Rock surface access	1,282×1,282	544,752	1.0000	Yes

The renderer requested 3,808 chunks, loaded all 3,808, reported zero missing, and used two fallback height maps. Both `atlas-manifest.json` and `area-inventory.json` are retained beside the seven sheets.

Decision and rejection trace

Wave 2 retained decisions that materially constrained the result:

1. The Raven Rock pilot stops before x `-135`; the wet edge is not silently filled, drained, or converted.
2. T2b remains a tunnel within a cavern rather than a box occupying the whole cavern.
3. R08 is a new non-overlapping connector; accepted R1 work is not replayed for cosmetic difference.
4. Full block states are required for fences and other property-bearing blocks. Material-only masks are not accepted.
5. An early MainStreet camera report with stale provenance is retained as rejected evidence.
6. Route success must be experiential and bidirectional. Offline topological connectivity alone is not acceptance.
7. Database records are imported only after physical state, rollback guards, routes, and matched media pass.

The full rationale is in `decision-and-rejection-log.md`, the Raven Rock engineering handoff, the MainStreet R08 dossier, and the independent integration audit.

Reproduction commands

Generate the immutable post atlas:

```
node scripts/generate_surface_atlas.mjs \
  --regions data/worldsnap-wave2-postrelease-d05ac7822795eff0-20260728/region \
  --out data/exports/box/redevelopment-atlas-wave2-post-2026-07-28/team-a
```

Run the final post verifier:

```
node scripts/qa_wave2_post_release.mjs \
  --post data/worldsnap-wave2-postrelease-d05ac7822795eff0-20260728/region \
  --transaction data/world-review/redevelopment-wave2-atomic-transaction-2026-07-28.json \
  --route-report data/world-review/redevelopment-wave2-route-qa-2026-07-28.json \
  --raven-after-report data/exports/redevelopment-wave2-2026-07-28/ravenrock/after/capture-
report.json \
  --mainstreet-after-report data/exports/redevelopment-wave2-2026-07-28/mainstreet-r08/after-
capture-report.json \
  --database data/world-map.db \
  --out data/world-review/redevelopment-wave2-post-release-qa-2026-07-28.json
```

Reproduce media QA:

```
node scripts/qa_wave2_media_catalog.mjs
npx vitest run test/build/generateWave2MediaRelease.test.ts
```

Generate the Wave 2 artifact register and dossier without touching the live world, databases, or Sites source:

```
node scripts/generate_redevelopment_artifact_register.mjs --profile wave2
node scripts/generate_redevelopment_dossier.mjs --profile wave2
```

Acceptance interpretation

Use the following exact language:

- **committed**: both physical packages completed through the atomic controller;
- **physically verified**: 887 explicit and two reactive post states plus 887 rollback guards pass;
- **experience verified**: both routes pass in both directions with zero movement-policy violations;
- **media verified**: 14 matched after views and 79 exact-object views pass;
- **database verified**: all 51 proposed external IDs exist and match the import contract;
- **accepted**: every gate in the post-release verifier passes;
- **published**: the accepted catalog, dossier, and a saved/deployed Sites version identify this release.

The last term is intentionally outside this offline documentation task. A successful PDF build must not be represented as a production Sites deployment.

Wave 2 Baseline and Release Readiness

Program: REDEV-2026-07-28-R2
Record type: PM control record
State: **BASELINE CONTROL CLOSED; WAVE 2 ACCEPTED**

This record preserves the readiness state and starting counts used to authorize the release. Final as-built facts are in as-built-release-report.md and post-release-independent-acceptance.md.

1. Frozen world baseline

Wave 2 engineering is pinned to:

Field	Value
Region directory	data/worldsnap-wave2-baseline-4fca1ff3-20260728/region
Directory SHA-256	4fca1ff3c40ae9c24c9338483b0780678aa5966bb570a642f0d0277885331a2b
Region files	26
Total bytes	122,744,700
Relationship to R1	Captured after the accepted R1 build, evidence, import, and publication

The mutable data/worldsnap/region directory is not a release identity. Any live Wave 2 transaction requires another content-addressed pre-release copy captured immediately after save-all flush.

2. Baseline atlas

The complete Wave 2 surface atlas is:

data/exports/box/redevelopment-atlas-wave2-baseline-2026-07-28/team-a

Measure	Result
Map sheets	7
Requested chunks	3,808

Measure	Result
Rendered chunks	3,808
Missing chunks	0
Fallback height maps	2

The atlas contains:

1. overall active-world surface;
2. Ravensreach core and old town;
3. Ravensgate;
4. western approach road;
5. Westlight venue and district;
6. western project corridor;
7. Raven Rock surface access.

Its `atlas-manifest.json` and `area-inventory.json` are the machine-readable source for map bounds, renderer inputs, completeness, and file identity.

3. Database and media baseline

The accepted R1 database is `data/world-map.db`, 2,256,896 bytes. The catalog used for the Wave 2 starting point is:

`data/exports/world-catalog-post-2026-07-27/object-media-index.json`

Measure	Baseline
Features	824
Buildings	69
Buildings with exact floor plan	68
Features with any screenshot	108
Features with exact-object screenshot	37
Buildings with any screenshot	15
Buildings with exact-object screenshot	14
Inventoried media files	195
Linked inventoried media files	132

The one exact-building floor-plan gap is the newly built C01 recessed portal. The exact-object building screenshot gap is 55 buildings. Wave 2 measures media success as a database-linked coverage delta, not an unlinked image count.

Baseline exact-building coverage by project

Project	Buildings	Exact floor plans	Exact-object screenshots
MainStreet America	32	31	12
Raven Rock	5	5	1
Ravensgate	4	4	0
Ravensreach	11	11	0
Westlight district	14	14	0
Westlight venue	3	3	1

4. Live fleet hold

Read-only checks on 2026-07-28 established:

Check	Result
Backend API	Healthy on 127.0.0.1:3001
Dashboard	Active on port 3000
Fleet size	5
Bot states	5/5 idle
Active missions	0
Last release hold commands	5/5 pause commands succeeded

This is a readiness observation, not a substitute for the same-moment release gate. The transaction coordinator must repeat bot, mission, player, entity, and operation-envelope checks immediately before a live build.

5. Physical-package integration gates

No tunnel or MainStreet candidate advances merely because its generator completes. Integration requires all of the following:

- exact baseline hash match;
- complete block-state properties for every source and desired state;
- unique target cells within each package;
- zero target intersections between packages;
- forward/rollback cell-set bijection;
- exact rollback source equal to forward desired state;
- no unhandled inventory, block entity, fluid, gravity, support, or protected room intersection;
- independent saved-world QA in addition to the generator's own report;
- strict group-aware dry run;
- bidirectional no-dig/no-tower route schedule;
- named database features and matched camera contract;
- conservative live entity envelope.

If only one physical package passes these gates, the other package is excluded from the release rather than weakening the accepted package or forcing a combined deadline.

6. Publication gates

Wave 2 is not complete at block execution. A release remains `committed-pending-post-qa` until all of these exist:

1. immutable post-release region snapshot and hash;
2. strict rollback postflight against that snapshot;
3. independent exact-state census;
4. successful bidirectional route observations;
5. matched post-build screenshots rendered from the post snapshot;
6. new feature/observation/media import with a database backup;
7. refreshed object-media index and coverage delta;
8. refreshed atlas where surface changes warrant it;
9. updated dossier/PDF and artifact register;
10. saved Sites version and successful owner-only production deployment.

7. Audit interpretation

The terms used in Wave 2 are intentionally distinct:

- **generated** means an offline artifact exists;
- **preflighted** means its guards match the named snapshot;
- **released** means the live exact-state transaction committed;
- **verified** means post-state and experience QA passed;
- **documented** means evidence is linked into the program record;

- **published** means the database, catalog, dossier, and production site all identify the accepted post-release state.

No report may silently promote one state to the next.

8. Final disposition

All ten publication gates above now have evidence except production Sites publication, which remains a separate external version/deployment step:

Gate	Final evidence
Immutable post snapshot	d05ac782...; 26 regions; 123,313,802 bytes
Rollback postflight	887 / 887 exact guards
Installed-state census	887 explicit plus two reactive states
Bidirectional routes	2 / 2 tests; 4 / 4 directions; zero policy violations
Matched post media	14 / 14 cameras
Database import	51 / 51 features; backup and integrity PASS
Database totals	875 features; 23 scans; 1,881 observations
Exact-object media	79 / 79 images; 69 / 69 building screenshots and floor plans
Post atlas	7 / 7 sheets; 3,808 / 3,808 chunks
Dossier and register	Wave 2 profile generated from accepted evidence

The independent final verifier reports `PASS` and decision `ACCEPTED` in `data/world-review/redevelopment-wave2-post-release-qa-2026-07-28.json`.

Wave 2 Integration Independent Audit

Decision: PASS – RELEASE ACCEPTED

Audit date: 2026-07-28 UTC

Transaction: redevelopment-atomic-release-wave2-2026-07-28

Machine report: data/world-review/redevelopment-wave2-integration-independent-qa-2026-07-28.json

Post-release report: data/world-review/redevelopment-wave2-post-release-qa-2026-07-28.json

Post-release report SHA-256:
551be053a21e37edc246f95cb2ded30df138f600f66c5574c2cf9b9b7f321d4c

Reproducer: node scripts/qa_wave2_integration_independent.mjs

Executive decision

The fresh Wave 2 prerelease integration was an offline **GO**. The candidate contains the bounded Raven Rock INF-RR-02 T2b liner and MainStreet R08 cross-link packages in a fixed two-package transaction. All independent structural, immutable-source, exact-state, reversible-simulation, finite-union, reactive-fence, intersection, protected-feature, camera, parser, and controller compatibility gates pass.

The live transaction and separate post-release acceptance are now complete. The immutable post snapshot, 887 explicit and two reactive installed states, exact rollback postflight, both bidirectional route contracts, all 14 matched after captures, and all 51 database records pass the independent post-release verifier. The detailed final disposition is docs/redevelopment/2026-07-28-wave2/post-release-independent-acceptance.md . The accepted read-only database census is bound to SHA-256 1bd71512b9246b67b25a7fff91cd0745eb47d089e66fa15ee7ab23a41b21a503 .

Authoritative prerelease identity

Item	Authoritative value
Manifest	data/buildops/redevelopment-wave2-release-manifest.json
Manifest SHA-256	df8ca8586b0415d2bc0a7653ec3a61d1c8ed333b90c9a05d4ca2b67d0cb946fe
Manifest state	prerelease-integration
Immutable regions	data/worldsnap-wave2-prerelease-b1356bca9fcbdc7a-20260728/region

Item	Authoritative value
Snapshot SHA-256	b1356bca9fcbdc7a90b580b2f9210947788d74716e1a706f5e8f0d0f789dbb27
Region files	26
Region bytes	123,279,631
Hash algorithm	SHA-256 over sorted filename + NUL + bytes + NUL

The independent audit recomputed the snapshot digest from the region members. It did not trust the filename, manifest declaration, or generator report.

Exact package accounting

Package	Forward source groups	REPL groups / cells	CMD groups	Finite unions	Rollback cells	Forward SHA-256	Rollback SHA-256
ravenrock-t2b	151	151	0	0	151	2ad97a32c2a48b28021edd2dd782acd78e0f07ed42b7d3949a0685bc06fd9690	56df298c3e35d94bb3ccc8abd83ebda8a2b49d5717aca24b9bbaf5a2be97bc61
mainstreet-r08	740	736	4	4	736	d9dea58a3c20ba6e5faca63fbb1ee7cc11857dc51e4956ff27624fee8c3da69f	5836dc47ce987fda6a10f2b00cb43e2a5582f93be215894c20294858274efd71
Total	891	887	4	4	887	—	—

All 887 explicit targets are unique inside their package. The two packages share no explicit or reactive target. Every rollback target is present in the forward package, every rollback source equals the forward desired state, and every rollback desired state is one of the exact forward sources.

The four MainStreet commands are guarded execute if block ... run data merge block operations. Each guard point equals its merge point, the point is also an explicit REPL target, and the command guard equals the sign state installed by that target. No unguarded command or WorldEdit leftover exists.

Immutable source and parser gates

Independent source reads found:

- Raven Rock: 151 of 151 exact source states match the fresh snapshot.
- MainStreet: 736 of 736 exact or finite-union source states match the fresh snapshot.
- No partial masks are used.
- Every state has the complete Minecraft 1.21.11 property set.
- No source or desired state is an unknown block.
- No operation target contains an existing block entity.

The authoritative prerelease preflights pass:

Package	Preflight	Result
Raven Rock	ravenrock-t2b-liner-pilot-wave2-prerelease-2026-07-28.prerelease-preflight.json	151 / 151
MainStreet	mainstreet-wave2-r08-prerelease-2026-07-28.prerelease-preflight.json	736 / 736

Strict parser-only dry runs also pass:

- Raven forward: 151 groups / 151 commands / zero leftovers.
- Raven rollback: 151 groups / 151 commands / zero leftovers.
- MainStreet forward: 740 groups / 744 commands / zero leftovers. The four extra commands are the second exact alternatives of the four finite unions.
- MainStreet rollback: 736 groups / 736 commands / zero leftovers.

Every dry-run operation hash equals the operation file audited here.

Finite-union and reactive-fence proof

The audit starts from the immutable block state, applies every forward cell in file order, and models the vanilla fence neighbor update after a fence is removed or restored. It does not assume that each later gate cell retains its snapshot state.

All four finite unions select alternative index 1 after the preceding fence cell is removed:

Point	Selected exact runtime source
(8,65, -126)	birch_fence[east=false,north=false,south=true,waterlogged=false,west=false]
(8,65, -125)	same
(-8,65, -126)	same
(-8,65, -125)	same

Exactly two non-target fence cells change:

Point	Immutable state	Projected forward state
(-8,65,-124)	birch_fence[east=false,north=true,south=true,waterlogged=false,west=false]	birch_fence[east=false,north=false,south=true,waterlogged=false,west=false]
(8,65,-128)	birch_fence[east=false,north=true,south=true,waterlogged=false,west=false]	birch_fence[east=false,north=true,south=false,waterlogged=false,west=false]

The simulated rollback runs in file order from the projected forward state. All 887 explicit targets and both reactive cells return byte-for-byte to their immutable block states. There are zero forward-source, rollback-source, or restoration mismatches.

Intersection and protection proof

The integration audit expands operation boxes to exact cells and includes both declared reactive cells in every intersection set.

Comparison	Result
Raven Rock vs MainStreet	0 cells
Wave 2 vs accepted five-package R1 target union	0 cells
Wave 2 vs active building, room, driveway, or landscape database bounds	0 cells
Wave 2 vs existing target block entities	0 cells

The database was opened read-only. Its SHA-256 was 005a714f90e1fc12a42de825b84290d07a9a090d0580b7112b277158e942123d before and after the audit. The 41 Raven Rock plus 10 MainStreet proposed external IDs are unique, have zero existing conflicts, and remain unimported.

Camera and provenance contract

All 14 prerelease cameras have unique IDs, unique outputs, exact primary-feature relations, the prerelease snapshot hash, a capture report bound to the exact manifest hash, and a current PNG whose SHA-256 matches the report.

Package	Cameras	Before evidence	After evidence
Raven Rock	6	PASS	required after transaction
MainStreet R08	8	PASS	required after transaction

During integration, two MainStreet capture reports briefly claimed PASS for the same paths while disagreeing on seven image hashes. That was a real provenance defect and integration was held. Engineering retained the stale record only as `rejected-stale-capture-report-7635f0.json`; it is not an accepted capture report. The fresh prerelease camera manifest and its single hash-consistent capture report are the release evidence audited here.

Controller compatibility

The audit imports `scripts/run_redevelopment_atomic_release.py` without executing it and loads the real manifest through `load_release_plan`. The loaded transaction ID, package order, operation paths, and manifest SHA-256 match the candidate.

The controller contract includes:

- a fresh all-package live gate no older than five minutes;
- an immediately repeated per-package entity gate;
- operation-hash binding between the entity gate and each forward file;
- prerelease-preflight path and region-path binding;
- strict-noop forward execution;
- fixed manifest order: Raven Rock, then MainStreet;
- reverse-order compensating rollback after any failure;
- non-strict rollback only for a potentially partial failing package;
- strict rollback for each previously committed package;
- a durable transaction ledger rewritten after each transition.

Route contracts

The post-release route runner must test normal walking with no digging, towering, sprinting, crouching, or flight.

Route	Endpoint A	Endpoint B	Required directions
RR-T2B-W2-BIDIRECTIONAL	(-145,3,187)	(-136,2,182)	2
MSA-R08-WEST-EAST-BIDIRECTIONAL	(-57,65,-124)	(56,65,-124)	2

Offline connectivity is not a substitute for these live tests.

Completed release gates

Before the transaction, release management:

1. paused or cleared blocking builders, players, and free entities;
2. passed the combined two-package live entity gate;
3. kept the prerelease snapshot, operations, manifest, preflights, and 14 before captures hash-frozen; and
4. executed through the fixed atomic controller in manifest order.

After the transaction, independent acceptance:

1. froze immutable post snapshot
`d05ac7822795eff03340e46695a6f3accbdfdf82d11559d857e17b4d1962999` ;
2. verified all 887 explicit installed states and both reactive fence states;
3. matched 887 of 887 rollback guards and restored the complete simulated prerelease state;
4. passed both route contracts in both directions;
5. rendered and hash-verified all 14 matched after cameras;
6. atomically imported and read-only verified all 51 database features; and
7. ran `scripts/qa_wave2_post_release.mjs` with final result `PASS`.

The exact post-release command is:

```
node scripts/qa_wave2_post_release.mjs \
  --post <immutable-post-region-directory> \
  --transaction <wave2-atomic-transaction-ledger.json> \
  --route-report <wave2-bidirectional-route-report.json> \
  --raven-after-report <raven-after-capture-report.json> \
  --mainstreet-after-report <mainstreet-after-capture-report.json> \
  --database data/world-map.db \
  --out data/world-review/redevelopment-wave2-post-release-qa-2026-07-28.json
```

`node scripts/qa_wave2_post_release.mjs --contract` prints the accepted input schema and route endpoints without reading or changing the live world.

The verifier independently requires: the all-package and repeated per-package entity gates; committed package order, strict execution results, and hashes; different immutable pre/post snapshot identities; all 887 installed block states; both projected reactive fence states; four sign block entities and all 16 authored text lines; 887 rollback guards; a complete simulated restoration to the prerelease state; four successful route directions; 14 same-camera, manifest-bound current after PNGs; and all 51 proposed external IDs in the read-only database census.

Verification commands executed

```
node scripts/qa_wave2_integration_independent.mjs
node scripts/qa_guarded_release_manifest.mjs \
  --manifest data/buildops/redevelopment-wave2-release-manifest.json \
  --out data/world-review/redevelopment-wave2-prerelease-manifest-qa-2026-07-28.json
npx vitest run \
  test/build/generateRavenRockT2bWave2.test.ts \
  test/build/generateMainstreetWave2R08.test.ts
python3 test/scripts/test_atomic_release_manifest.py
python3 test/scripts/test_rcon_runner.py
```

Results: 12 of 12 independent integration gates, 11 of 11 focused generator tests, 4 of 4 controller-manifest tests, and 7 of 7 RCON runner tests pass.

Wave 2 Post-Release Independent Acceptance

Decision: PASS – RELEASE ACCEPTED
Acceptance time: 2026-07-28T02:42:09.174Z
Transaction: redevelopment-atomic-release-wave2-2026-07-28
Machine report: data/world-review/redevelopment-wave2-post-release-qa-2026-07-28.json
Machine report SHA-256: 551be053a21e37edc246f95cb2ded30df138f600f66c5574c2cf9b9b7f321d4c
Reproducer: scripts/qa_wave2_post_release.mjs

Executive acceptance

Wave 2 is accepted as built. The bounded Raven Rock INF-RR-02 T2b liner pilot and MainStreet America R08 cross-link were committed in the declared two-package order, captured in a new immutable saved-world snapshot, and independently verified against the exact prerelease and rollback contracts.

The final read-only verifier passes all eight acceptance gates:

1. prerelease and post-release snapshot identity;
2. Raven Rock installed state and exact rollback;
3. MainStreet installed state, reactive fence state, signs, and exact rollback;
4. all-package and repeated per-package live entity clearance;
5. atomic transaction order, hashes, and strict execution;
6. both live normal-walk routes in both directions;
7. all 14 matched after captures; and
8. all 51 proposed database features.

The acceptance verifier did not connect to or mutate the live world and opened data/world-map.db read-only. The database SHA-256 was identical before and after its census.

Frozen release identity

Artifact	Authoritative value
Release manifest	data/buildops/redevelopment-wave2-release-manifest.json
Manifest SHA-256	df8ca8586b0415d2bc0a7653ec3a61d1c8ed333b90c9a05d4ca2b67d0cb946fe

Artifact	Authoritative value
Transaction ledger	data/world-review/redevelopment-wave2-atomic-transaction-2026-07-28.json
Ledger SHA-256	e9b3752e89771c4ab218e5811bf23700cfd5f08128e9277324ca9df990f43ef2
Prerelease snapshot	data/worldsnap-wave2-prerelease-b1356bca9fcbdc7a-20260728/region
Prerelease SHA-256	b1356bca9fcbdc7a90b580b2f9210947788d74716e1a706f5e8f0d0f789dbb27
Post-release snapshot	data/worldsnap-wave2-postrelease-d05ac7822795eff0-20260728/region
Post-release SHA-256	d05ac7822795eff03340e46695a6f3accbdfdf82d11559d857e17b4d1962999
Post-release regions	26 files / 123,313,802 bytes

The post snapshot digest differs from the prerelease digest and matches every transaction, route, after-media, and database-import evidence record consumed by the final audit.

Transaction and installed-state proof

The durable transaction ledger records both packages committed in manifest order:

Order	Package	Forward result	Exact targets	Extra contract
1	ravenrock-t2b	151 / 151, strict-noop, zero failures	151	addition-only T2b dry liner
2	mainstreet-r08	740 / 740 source groups, strict-noop, zero failures	736	four guarded sign commands and two reactive fence cells

The verifier decoded the post-release Anvil snapshot and checked all 887 explicit target cells against their desired complete block states. It also checked the two non-target fence cells whose connection properties change reactively when the adjacent gate fence is removed. All 889 projected cells match.

The four MainStreet sign block entities exist at their guarded coordinates and contain all 16 authored text lines. No command was accepted on the strength of the transaction log alone; the resulting block entities were inspected in the post snapshot.

Rollback verification is complete without replaying rollback against the live world. All 887 rollback guards match the immutable post state, and an independent in-memory rollback simulation restores all 887 explicit cells and both reactive fence cells to the exact prerelease state. There are zero guard, simulation, or restoration mismatches.

Entity and route evidence

The all-package live entity gate is `data/world-review/redevelopment-wave2-live-entity-gate-2026-07-28.json`. It is bound to the exact operation hashes, reports zero blocking players or free entities for both packages, and precedes execution within the permitted freshness window. The controller also repeated the entity check immediately before each package; both repeated checks pass.

The authoritative route record is `data/world-review/redevelopment-wave2-route-qa-2026-07-28.json`, bound to the post snapshot SHA-256. It passes four of four directions:

Route	Endpoints	Forward	Reverse
RR-T2B-W2-BIDIRECTIONAL	(-145,3,187) ↔ (-136,2,182)	PASS	PASS
MSA-R08-WEST-EAST-BIDIRECTIONAL	(-57,65, -124) ↔ (56,65, -124)	PASS	PASS

These were normal walking checks with no digging, towering, sprinting, crouching, or flight. They satisfy the release movement contract rather than merely demonstrating offline block connectivity.

Matched post-release media

All 14 required after captures exist and pass their current-file SHA-256, camera-parameter, feature-relation, manifest, and post-snapshot bindings:

Package	Required	Verified	Evidence
Raven Rock	6	6	<code>data/exports/redevelopment-wave2-2026-07-28/ravenrock/after/capture-report.json</code>
MainStreet R08	8	8	<code>data/exports/redevelopment-wave2-2026-07-28/mainstreet-r08/after-capture-report.json</code>

Every accepted after image differs from its matched before image. The previously identified stale MainStreet capture report remains explicitly rejected and is not part of the accepted evidence chain.

Database acceptance and recovery

The database release was a separate, bounded atomic import after physical and media acceptance. Its ledger is `data/world-review/redevelopment-wave2-database-import-2026-07-28.json`.

Database check	Result
Raven Rock features	41 / 41
MainStreet features	10 / 10
Total imported features	51 / 51
New scans	2
New observations	51
Database counts	875 features / 23 scans / 1,881 observations
SQLite integrity	ok
Foreign-key violations	0
Accepted database SHA-256	1bd71512b9246b67b25a7fff91cd0745eb47d089e66fa15ee7ab23a41b21a503

The pre-import recovery image is `data/backups/world-map-wave2-preimport-20260728T024110Z.db`, SHA-256 `a9af19a2823464a6a190f53283ae4d0215e49d44a6481a3b2fe0a80b455cef06`. It contains the exact 824-feature / 21-scan / 1,830-observation pre-import database state.

The final post-release verifier independently queried all 51 external IDs read-only and found 51 rows with no missing ID. Its before-read and after-read database hashes are identical.

Machine-verifiable result

Run the acceptance check without changing the live world or database:

```
node scripts/qa_wave2_post_release.mjs \
  --post data/worldsnap-wave2-postrelease-d05ac7822795eff0-20260728/region \
  --transaction data/world-review/redevelopment-wave2-atomic-transaction-2026-07-28.json \
  --route-report data/world-review/redevelopment-wave2-route-qa-2026-07-28.json \
  --raven-after-report data/exports/redevelopment-wave2-2026-07-28/ravenrock/after/capture-report.json \
  --mainstreet-after-report data/exports/redevelopment-wave2-2026-07-28/mainstreet-r08/after-capture-report.json \
  --database data/world-map.db \
  --out data/world-review/redevelopment-wave2-post-release-qa-2026-07-28.json
```

Accepted totals:

- 2 of 2 packages;
- 8 of 8 acceptance gates;

- 887 of 887 explicit installed states;
- 2 of 2 reactive fence states;
- 887 of 887 rollback guards and restorations;
- 4 of 4 guarded sign commands;
- 2 of 2 routes and 4 of 4 directions;
- 14 of 14 matched after cameras; and
- 51 of 51 imported database features.

The machine decision is `PASS` , with release disposition `ACCEPTED` and an empty failure list.

Raven Rock Tunnel Wave 2 Engineering Release

Date: 2026-07-28

Program: REDEV-2026-07-28-R2

Package: INF-RR-02

Selected feature: RR-T2B-LINER-PILOT-W2

State: **OFFLINE PASS — LIVE RELEASE GATES PENDING**

1. Outcome

Wave 2 now has a complete read-only inventory of Raven Rock's named tunnel legs, decision nodes, cavern thresholds, and RR-Z5 stair flights, plus a bounded implementation package for the highest-priority remaining tunnel defect.

The selected package authors ten dry stations of T2b, x `-145..-136`, as a five-wide, five-high public route inside the existing natural cavern. It keeps the existing stone-brick tread and every existing clear cell. It adds only the elements needed to make the route legible:

- polished-deepslate side liners;
- an amber/brick Habitation route band;
- a stone-brick ceiling family;
- three evenly spaced sea-lanterns;
- one deliberate 3 × 3 dry-side cave window.

The package performs no excavation. All 151 changed source cells are exact `minecraft:air`, and every operation is a one-cell exact-state `REPL`.

Independent QA is `PASS_OFFLINE_LIVE_GATES_PENDING`: 34/34 gates, 10/10 section stations, 151/151 source guards, zero target hazards, zero fluid-adjacent targets, zero block entities, and exact rollback restoration.

This is not a live-build claim. No Minecraft, RCON, database, or Sites state was mutated by this work.

The authoritative offline-release manifest is `data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.release.json`. Its state is `OFFLINE_READY_LIVE_ROUTE_AND_TRANSACTION_GATES_PENDING`, and its `authorizedForLiveExecution` field remains `false`.

2. Immutable source of truth

Field	Value
Region directory	<code>data/worldsnap-wave2-baseline-4fca1ff3-20260728/region</code>
Snapshot SHA-256	<code>4fca1ff3c40ae9c24c9338483b0780678aa5966bb570a642f0d0277885331a2b</code>
Region files	26
Region bytes	122,744,700
Hash method	SHA-256 over sorted filename + NUL + bytes + NUL
Planning source	<code>raven-rock/planning/coordinates.yaml</code>
Governing standards	<code>docs/redevelopment/2026-07-27/infrastructure-standards.md</code>
Accepted predecessor	<code>docs/redevelopment/2026-07-27/tunnel-repair-release.md</code>
Database	<code>data/world-map.db</code> , opened read-only

`data/worldsnap/region` is not used. The earlier R1 snapshots are historical evidence only. Any live release requires a new same-moment immutable snapshot and a complete re-preflight.

All Raven Rock interior geometry is a labeled creative approximation. This package improves the Minecraft reconstruction; it does not claim to depict a classified real-world interior.

3. Inventory scope

The machine inventory is:

`data/world-review/ravenrock-wave2-tunnel-inventory-2026-07-28.json`

It records:

- 10 named route legs;
- 15 named portals, vestibules, junctions, thresholds, and protected nodes;
- 16 RR-Z5 landing levels;
- 15 RR-Z5 switchback flights;
- 5 existing broad building-circulation database objects;
- per-route snapshot samples;
- per-node local material/fluid probes;
- current database coverage;
- Wave 2 disposition and remaining work.

3.1 Tunnel legs

ID	Role	Snapshot tread/support samples	Max perpendicular / vertical deviation	Wave 2 disposition
RR-T1a	North portal → N1, public primary	22/22	0 / 1	Later primary-spine rollout
RR-T1b	N1 → Cavern A, public primary	11/11	0 / 1	Later N1/threshold rollout
RR-T2a	South portal → dogleg, public primary	13/13	0 / 1	Later dogleg/wayfinding package
RR-T2b	Dogleg → Cavern B, public primary	15/15	0 / 1	Selected INF-RR-02 pilot
RR-T3a	East portal → N2, public primary	15/15	0 / 1	Later primary-spine rollout
RR-T3b	N2 → Cavern A, public primary	15/15	4 / 5	Survey section changes before lining
RR-T4	West utility leg, service/dead-end	15/15	2 / 1	Preserve aquifer bulkhead; sign no exit
RR-C1	Cavern A ↔ B, public primary	8/8	0 / 0	Later destination-continuity package
RR-C2	Cavern A ↔ C, operational secondary	4/6	6 / 5	Wet threshold and path survey required
RR-S1	Cavern A → RR-Z5, public primary	17/17	3 / 2	R1 pilot retained; remaining stations later

The support sampler accepts both authored tread and stable natural support. A missing sample is not interpreted as a missing route. C2's two misses, its wet Cavern C node, and its higher deviations are explicit risk evidence for a later, separately bounded survey.

3.2 Nodes and thresholds

The inventory includes:

Family	IDs
Blast vestibules	RR-N1, RR-N2
Portals	RR-N3, RR-N4, RR-N5, RR-N6
Shaft / central nodes	RR-N9, RR-N10
Route decisions	RR-J-T2-DOGLEG, RR-J-T3-S1
Cavern thresholds	RR-J-C1-A, RR-J-C1-B, RR-J-C2-A, RR-J-C2-C

Family	IDs
Protected infrastructure	RR-J-T4-BULKHEAD

Each node has a 175-cell local snapshot probe. The two important fluid results are retained:

- RR-N6 local probe: 10 fluid cells; the western portal remains unusable.
- RR-J-C2-C local probe: 27 fluid cells; the Cavern C threshold needs a wet interface design.

The remaining node probes contain no fluid.

3.3 RR-Z5 stair and landing inventory

The shaft census covers x 196..204, y -12..64, z -19..-11:

Item	Measured count
Stair blocks	150
Stair blocks per measured y level	2
Ladder blocks	0
Iron-bar blocks	911
Planned/observed landing levels	16
Inter-landing flights	15
Fluid/gravity hazards	0

Landing levels are y -11, -6, -1, 4, 9, 14, 19, 24, 29, 34, 39, 44, 49, 54, 59, 64.

The stair exists and is ladderless, but those facts do not prove comfort. A later package must isolate one flight and its upper/lower landings, then prove two-block width, three-block headroom, edge continuity, sign continuity, and normal-speed travel in both directions. No RR-Z5 cell is touched by INF-RR-02.

4. Database census and proposal

The read-only database contains 40 Raven Rock features. It contains buildings, rooms, the district, broad building-circulation objects, the shaft, and the accepted R1 S1 pilot, but no first-class record for any of the ten route legs inventoried here.

The import-ready proposal is:

data/world-review/ravenrock-wave2-tunnel-database-features-2026-07-28.json

It contains 41 proposed records:

Record family	Count
Tunnel leg records	10
Node/portal/threshold records	15
RR-Z5 flight records	15
INF-RR-02 package feature	1
Total	41

All records remain planned/not imported. Condition score is null. Physical completion, functional performance, walkability, legibility, and media coverage remain separate evidence states. No quality dimension defaults to 100.

The INF-RR-02 operation buffer intersects only the Raven Rock district parent in three dimensions. It intersects no registered building, room, inventory, shaft, accepted S1 pilot, or other first-class feature.

5. Package selection

5.1 Why T2b

R1 deliberately called for T2b after acceptance of the S1 section family. T2b is not too narrow: its median measured width was approximately 14 blocks, and its route identity dissolves into a large cave-adjacent void. The governing prescription is a five-wide “tunnel within cavern,” not broader excavation.

5.2 Why x -145..-136

The original planning pilot suggested x -145..-135. The Wave 2 immutable snapshot adds decisive evidence:

- a dry, complete tread and clear path exists through x -136;
- water occupies the audit buffer at x -135, z 178, y 1..9;
- the adjacent chunk continues the water body at x -134, z 177..179;
- including x -135 would make the terminal shell fluid-adjacent;
- ending at x -136 leaves every selected target non-face-adjacent to water.

The package therefore selects the largest contiguous dry portion and records x -135 as an explicit rejected boundary.

Release stop condition: if a same-moment release snapshot shows fluid, waterlogging, gravity blocks, or a fluid/gravity block sharing a face with any target, stop and regenerate. Do not trim the live command list by hand.

5.3 Rejected alternatives

Alternative	Rejection
Include x -135	Active aquifer edge makes the shell fluid-adjacent
Normalize all of T2b	Excessive rollback volume and natural-cave overfill risk
Excavate a new straight tube	Existing tread is continuous; excavation is unnecessary
Fill the whole cave	Destroys the deliberate cavern experience
Combine RR-Z5 stair work	Mixes different failure modes and prevents clean diagnosis

6. Exact centerline and section

6.1 Station schedule

x	Walk y	Center z	Floor y	Clear z	Clear y	Ceiling y
-145	3	187	2	185..189	3..7	8
-144	3	187	2	185..189	3..7	8
-143	3	186	2	184..188	3..7	8
-142	2	185	1	183..187	2..6	7
-141	2	185	1	183..187	2..6	7
-140	2	184	1	182..186	2..6	7
-139	2	184	1	182..186	2..6	7
-138	2	183	1	181..185	2..6	7
-137	2	183	1	181..185	2..6	7
-136	2	182	1	180..184	2..6	7

The single one-block vertical transition occurs after three horizontal stations. Each adjacent centerline pair changes x by one and changes y/z by at most one. The package retains the existing tread rather than creating a new stair.

6.2 Cross-section

Looking along increasing x:

The ceiling is stone brick. Sea-lanterns sit over the centerline at x -144, -140, -136. The 3 x 3 tinted-glass window occupies the positive-z side at x -141..-139, one to three blocks above walk level.

7. Operation accounting

The complete section relation contains 450 cells:

State	Cells
Already equal to design	299
Exact changed targets	151
Total design cells	450

Changed targets by role:

Role	Operations
Existing-tread completion	1
Polished-deepslate side liner	74
Brick Habitation route band	17
Tinted-glass intentional window	9

Role	Operations
Stone-brick ceiling	47
Sea-lantern ceiling rhythm	3
Total	151

Desired materials:

Material	Operations
Stone bricks	48
Polished deepslate	74
Bricks	17
Tinted glass	9
Sea lantern	3

Every changed source is exact `minecraft:air`. There are:

- zero `SET` operations;
- zero `CMD` operations;
- zero broad boxes;
- zero masks;
- zero excavation targets;
- zero duplicate targets;
- zero targets above y41;
- zero targets at x `-135`;
- zero targets at RR-Z5, T4 bulkhead, or accepted S1.

8. Fluid, gravity, entity, and support evidence

The 1,680-cell audit buffer is x `-146..-135`, y `0..9`, z `178..191`. Both required chunks are present.

8.1 Water census

Twelve water cells exist in the buffer:

- three source cells at y0, z178, x `-146..-144`;
- nine contained cells at x `-135`, z178, y `1..9`.

No water cell is targeted. No target shares a block face with water. The independent QA recomputes this using all six neighbor directions for all 151 targets.

8.2 Other hazards

Hazard	Count
Target fluid/gravity/waterlogged cells	0
Face-adjacent target hazards	0
Block entities	0
Missing block-entity chunks	0
Support-dependent buffer blocks	0
Sand/gravel/suspicious gravity blocks	0
Targets intersecting a registered room/building	0

The water is evidence, not a cleanup target. It remains in place.

9. Guard and rollback contract

Every forward line has the exact form:

```
REPL x y z x y z minecraft:air <one-exact-pilot-state>
```

The rollback:

- reverses forward order;
- swaps exact expected and replacement states;
- contains 151 one-cell operations;
- removes only a pilot block that still exactly matches;
- restores every applied target to exact air;
- leaves an unapplied or later-modified target untouched.

The independent simulation applies all 151 operations to a fresh census, validates every section cell, applies the rollback, and finds zero restoration differences.

Sequential RCON is not database-style ACID. “Atomic” here means one bounded transaction with exact guards, fixed ordering, post-verification, and automatic reverse-order compensation on any partial failure.

10. Camera and media contract

The manifest is:

```
data/exports/redevelopment-wave2-2026-07-28/ravenrock/t2b-camera-manifest.json
```

It defines six exact-primary same-camera pairs:

ID	Purpose
RR-T2B-W2-WEST-TO-EAST	Approach, cavern, water, and route-loss context
RR-T2B-W2-EAST-TO-WEST	Reverse movement and section context
RR-T2B-W2-CAVE-WINDOW	Intended window and dry-side edge
RR-T2B-W2-SECTION	Five-wide/five-high typical route section
RR-T2B-W2-AQUIFER-EXCLUSION	Rejected x=-135 wet boundary
RR-T2B-W2-OBLIQUE	Shell, window, and light rhythm overview

All six frozen before images were rendered offline from the Wave 2 baseline. The capture report is:

```
data/exports/redevelopment-wave2-2026-07-28/ravenrock/before/capture-report.json
```

Renderer status is `PASS`. The initial section camera was rejected because a near plane obscured the lower image. The corrected camera is:

```
eye    = (-139, 4.5, 184)
lookAt = (-145, 4.5, 187)
fov     = 65
```

The generator now verifies every unique voxel on that source-state sight ray is air. The corrected image is 29,671 bytes with luminance variance 608.082, range 93.072, and 18 quantized colors.

After images do not exist and must not be synthesized as acceptance evidence. They are captured from the post-release snapshot using the exact same manifest.

11. Automated validation

11.1 Generator

```
node scripts/generate_ravenrock_t2b_wave2.mjs
```

Expected:

- immutable hash match;
- 450 design cells;
- 151 forward and 151 rollback operations;
- 12 buffer water hazards;
- 0 target hazards;
- 0 face-adjacent target hazards;
- 41 database proposals;
- 6 cameras.

11.2 Generic preflight

```
node scripts/preflight_guarded_ops.mjs \  
  data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.txt \  
  --regions data/worldsnap-wave2-baseline-4fca1ff3-20260728/region \  
  --report data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.preflight.json
```

Result: 151/151 exact guards pass; zero failures.

11.3 Independent QA

```
node scripts/qa_ravenrock_t2b_wave2.mjs
```

Result:

- status `PASS_OFFLINE_LIVE_GATES_PENDING`;
- 34/34 independent gates;
- 10/10 section stations;
- zero failed assertions;
- exact rollback restoration.

11.4 Parser dry runs

```
python3 scripts/rcon_runner.py \  
  data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.txt \  
  --dry-run --strict-noop \  
  --report data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.dry-run.json  
  
python3 scripts/rcon_runner.py \  
  data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.rollback.txt \  
  --dry-run --strict-noop \  
  --report data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.rollback.dry-run.json
```

Each parses 151 operations into 151 vanilla `/fill` commands with zero WorldEdit leftovers.

11.5 Focused tests

```
npx vitest run test/build/generateRavenRockT2bWave2.test.ts
```

Result: one test file, three tests, three passed.

11.6 Offline release finalizer

```
node scripts/finalize_ravenrock_t2b_wave2.mjs
```

The finalizer verifies the report, 151/151 preflight, independent QA, both strict dry runs, full inventory, 41-feature proposal, camera ray, six-image capture report, manifest binding, and wet-boundary exclusion. It hashes every release artifact and writes the authoritative offline-release manifest.

12. Live release gates

Offline PASS is not execution authority. Immediately before a live transaction:

1. pause every fleet bot;
2. require no active or queued world-building mission;
3. clear players and free entities from the audit buffer;
4. `save-all flush`;
5. capture a new immutable same-moment snapshot;
6. reproduce all 151 exact source guards;
7. recompute the full fluid-neighbor census;
8. stop if x=-135 water moved or any target became fluid-adjacent;

9. execute INF-RR-02 as its own fixed-order transaction;
10. compensate in reverse order on the first partial failure;
11. `save-all flush` and freeze the post snapshot;
12. require all 151 rollback guards to match installed state;
13. perform normal-speed walks in both directions without sprint, jump, crouch, dig, or tower;
14. capture all six same-camera after views;
15. import database/media only after independent post-state PASS.

The required live route endpoints are explicit:

Direction	Start	Finish
Dogleg side → Cavern B side	(-145,3,187)	(-136,2,182)
Cavern B side → dogleg side	(-136,2,182)	(-145,3,187)

Both runs use normal speed and forbid sprint, jump, crouch, dig, tower, flight, and spectator movement. Each must reach the opposite endpoint without water contact, collision, fall, or leaving the authored route.

13. Remaining Raven Rock tunnel work

The package intentionally leaves:

1. the x `-135` wet threshold and remaining T2b route to Cavern B;
2. one RR-Z5 switchback flight plus its upper and lower landings;
3. T2 dogleg advance, decision, and confirmation wayfinding;
4. T1a/T1b uniform primary-spine rollout and N1 threshold;
5. T3a/T3b uniform primary-spine rollout and N2 threshold;
6. C1 public connector identity and both cavern thresholds;
7. C2 utility-secondary identity and wet Cavern C threshold;
8. T4 “service/dead-end — no surface exit” signing while preserving the x `-278/-277` aquifer bulkhead;
9. the S1 stations outside accepted R1 x `138..148`;
10. live bidirectional, time, lighting, and wayfinding evidence for every named segment.

14. Artifact register

Artifact	Purpose
<code>scripts/generate_ravenrock_t2b_wave2.mjs</code>	Immutable generator, full inventory, database, camera, safety logic

Artifact	Purpose
scripts/qa_ravenrock_t2b_wave2.mjs	Independent section/source/neighbor/rollback QA
scripts/finalize_ravenrock_t2b_wave2.mjs	Complete evidence-chain validator and offline release manifest
test/build/generateRavenRockT2bWave2.test.ts	Focused regression tests
data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.txt	151 exact forward operations
data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.rollback.txt	151 reverse-order exact rollback operations
data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.prestate.json	Complete 450-cell relation and 1,680-cell safety evidence
data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.report.json	Machine design/release report
data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.preflight.json	151/151 immutable guard result
data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.qa.json	Independent 34-gate result
data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.release.json	Authoritative offline-ready state, hashes, live endpoints, and stop conditions
data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.dry-run.json	Forward parser dry run
data/buildops/ravenrock-t2b-liner-pilot-wave2-2026-07-28.rollback.dry-run.json	Rollback parser dry run
data/world-review/ravenrock-wave2-tunnel-inventory-2026-07-28.json	All route, node, shaft, and database coverage evidence
data/world-review/ravenrock-wave2-tunnel-database-features-2026-07-28.json	41 proposed/import-ready records; not imported
data/exports/redevelopment-wave2-2026-07-28/ravenrock/t2b-camera-manifest.json	Six same-camera before/after contracts
data/exports/redevelopment-wave2-2026-07-28/ravenrock/before/capture-report.json	Frozen before-image hashes and renderer QA

MainStreet America Wave 2 — R08 engineering dossier

Date: 2026-07-28

Package: `mainstreet-america-redevelopment-wave2-r08`

Decision: **PASS_OFFLINE_ONLY**

Live-world mutation: **none**

1. Executive decision

Wave 2 selects the missing midblock connection between R06 and R07 as the highest-impact MainStreet defect that can be engineered without replaying the accepted R1 work.

The selected intervention is a three-wide public shared cross-link named R08. It connects the accepted West Rear Alley to the accepted East Rear Alley, crosses R01 at grade, opens two deliberate three-cell gates in the inner neighborhood fences, and adds four guarded district directory pylons.

The package is complete as an offline engineering product:

- 354 connected route surface cells;
- 736 exact-guarded replacement cells;
- four guarded sign-data commands;
- 736/736 immutable-snapshot preflight guards passing;
- zero accepted-R1 target overlap;
- zero building, room, driveway, landscape, R1 garage, tree, or existing block entity targets;
- six and only six declared fence cells;
- four full-state finite-union fence guards;
- two explicitly modeled adjacent reactive fence states;
- exact reverse rollback with 736 guarded cells;
- 32/32 independent QA checks passing;
- 8/8 focused tests passing;
- backend TypeScript build passing;
- eight corrected, source-bound baseline images.

This is not authorization to run the package live. Any future release must refresh a saved-world snapshot, regenerate the exact guards, clear entities, capture same-camera before images, execute the whole package as one strict transaction, and run bidirectional route and sign QA.

2. What this wave audits

The user asked for the remaining MainStreet spacing, road, comprehension, building-integration, venue-finding, and two-street problems to be examined together. The audit separates what can safely be improved now from what needs a larger coordinated phase.

Requested concern	Current evidence	Wave 2 disposition
Objects feel too close or too far apart	R06 and R07 are about 135 blocks apart; ST-03 targets no more than 100 blocks between public connections	Physical R08 cross-link selected
Roads do not read as a complete grid	R01, R02, R03, R06, R07, and the two R1 alleys exist, but the north residential superblock has no named middle connection	R08 connects both alleys through R01
Turning a corner is confusing	Database identities exceed visible in-world identities	Four decision-point directories added
B02 and B03 feel detached	R1 preserved both buildings and completed their primary service relationships	No relocation; R08 directories name B02/B03 and route via R06/R07
C01/stadium is hard to find	C01 Training Arena and Westlight venue can be verbally conflated	Signs use distinct C01 and WESTLIGHT VENUE identities
Westlight route is unclear	Westlight is not on the MainStreet surface grid	Regional sign states Ravensreach → Ravensgate → west Approach Road
Two-street logic is incomplete	R02/R03 and the rear alleys exist, but a full new R02-R03 street would breach outer fences	Internal shared cross-link selected; full R02-R03 cut-through rejected
Houses/buildings may need relocation	Accepted R1 garage and alley work already made all 18 houses serviceable	No house or building movement in this package
B02/B03 should be brought closer	Moving authored buildings would create a larger demolition and database migration problem	Use network integration first; relocation remains rejected

3. Source of truth

3.1 Immutable saved-world baseline

All geometry, block states, headroom, fence properties, block entities, and camera visibility evidence come from:

```
data/worldsnap-wave2-baseline-4fca1ff3-20260728/region
```

Property	Value
Hash algorithm	SHA-256 over sorted filename + NUL + bytes + NUL
SHA-256	4fca1ff3c40ae9c24c9338483b0780678aa5966bb570a642f0d0277885331a2b
Region files	26
Bytes	122,744,700
Mutable snapshot used	No
Live server contacted	No

The generator fails closed if the directory hash, region-file count, or byte count differs.

3.2 Database baseline

data/world-map.db is opened with readonly: true and fileMustExist: true.

The protection query covers complete, non-removed:

- buildings;
- rooms;
- driveways;
- landscape features.

The accepted R1 garage matrix is also checked because garages are represented more precisely in the accepted R1 report than in the current feature-kind census.

No database row is inserted or updated. Ten proposed feature payloads are included in the report for a later reviewed import.

3.3 Accepted R1 baseline

The package treats all five accepted R1 target sets as immutable:

Accepted package	Role in overlap audit
westlight-infinity-screen-2026-07-27.txt	Westlight venue target protection
ravenrock-s1-section-pilot-2026-07-27.txt	Raven Rock target protection
mainstreet-redevelopment-r4-r5-runtime-safe-2026-07-27.txt	Alleys, garages, frontage, B02/B03, and wayfinding protection
mainstreet-bunker-surface-phase1-2026-07-27.txt	Bunker surface target protection
mainstreet-bunker-recessed-portal-phase2-2026-07-27.txt	Recessed portal target protection

The generated R08 target set has zero cell overlap with their union.

4. Standards applied

The package implements the already adopted infrastructure standards:

Standard	R08 application
ST-01 connected hierarchy	R08 is explicitly classified as a pedestrian/shared-street cross-link
ST-02 widths	Three blocks, the minimum cross-street width
ST-03 connection interval	Adds an equivalent connection inside the 135-block R06-R07 interval
ST-04 compact intersection	Preserves both continuing routes and adds destination information before route choices
ST-07 grade	Entire route is at y=64; maximum adjacent step is zero
WF-02 wayfinding	B02, B03, C01, R01, R06, R07, both alleys, and Westlight receive explicit directional language

R08 is a shared surface rather than a fast through street. That classification keeps the clear route at three blocks and avoids a seven-block road/sidewalk cut through authored residential landscape.

5. Alternatives and rejection record

5.1 Full R02-R03 street

Study envelope: approximately x=-80..82 near z=-124.

Rejected because it would:

- cut the registered outer west neighborhood fence;
- cut the registered outer east neighborhood fence;
- require new R02 and R03 curb transitions;
- create more surface and reactive-fence risk than needed to address the current block-length defect;
- overlap the functional territory already served by R1 alleys.

5.2 Straight R08 at z=-124

Rejected after block-by-block survey.

A straight line would target two authored sea-lantern gateway markers near x=-7 and x=7 and would place the new gate in a weak relationship to the existing quartz fence piers.

5.3 Existing central gate at z=-147..-143

Rejected because that otherwise convenient five-wide opening aligns with:

- The Timbergrove envelope at x=-46..-22, z=-157..-133;
- The Midtown envelope at x=26..38, z=-151..-140.

Using the opening would turn a public cross-link into a route through authored building footprints.

5.4 Existing gate at z=-197..-193

Rejected because it aligns with The Wakefield and The Valencia building and room envelopes.

5.5 Existing gate at z=-97..-93

Rejected because it aligns with The Centennial and The Cross Creek building and room envelopes.

5.6 R02 widening

Deferred. ST-02 explicitly says widening existing R02 is a study, not a presumption. The current package does not trade house, fence, or comfortable grade protection for width.

5.7 Wayfinding-only package

Rejected as the sole remedy. Signs would help comprehension but would leave the 135-block connection interval physically unchanged.

6.1 Network diagram

All coordinates are inclusive.

6.3 Bidirectional endpoints

Direction	Start	End	Result
West → east	[- 57,65 , - 124]	[56,65 , - 124]	Connected

Direction	Start	End	Result
East → west	[56,65,-124]	[-57,65,-124]	Connected

The west endpoint is one block from accepted ALLEY-W surface cell [-58,64,-124] .

The east endpoint is one block from accepted ALLEY-E surface cell [57,64,-124] .

Neither accepted alley cell is retargeted.

6.4 R01 continuation

R01 remains continuous north/south through the new crossing:

- north continuation: [0,65,-128] ;
- crossing: x=-5..5, z=-127..-125;
- south continuation: [0,65,-124] .

The R08 surface changes material at the intersection but never introduces air, an obstacle, or a vertical step into R01.

6.5 Grade and clearance

Measure	Result
Minimum surface Y	64
Maximum surface Y	64
Maximum adjacent step	0
Required headroom	3 blocks
Headroom failures	0
Bidirectional jump/sprint/crouch requirement	None in offline geometry

7. Material and operation schedule

7.1 Palette

Role	Material
Uniform foundation	minecraft:stone_bricks
Shared route lanes	minecraft:gray_concrete

Role	Material
Continuous centerline	<code>minecraft:yellow_concrete</code>
R01 compact crossing edge	<code>minecraft:white_concrete</code>
Directory base	<code>minecraft:polished_andesite</code>
Directory pier	<code>minecraft:stone_bricks</code>
Directory lamp	<code>minecraft:sea_lantern</code>
Directory face	Exact-state <code>minecraft:oak_sign[...]</code>

7.2 Operation counts

Role	Exact guarded cells
Uniform foundation	354
Shared cross-link gray surface	218
Yellow centerline	118
R01 white crossing	18
Declared gate clearance	6
R01 curb crossing clearance	6
Four directory bases	4
Four directory piers	4
Four directory lamps	4
Four directory signs	4
Total REPL targets	736
Guarded sign-data commands	4

Every replacement is a one-cell `REPL` with an immutable-snapshot exact source state. The sign commands use `execute if block <full sign state> run data merge block ...`.

8. Fence physics and exact-state safety

8.1 Declared gate cells

Only these six fence cells are removed:

Gate	Exact target cells
GATE-R08-WEST-MAIN	<code>[-8,65,-127]</code> , <code>[-8,65,-126]</code> , <code>[-8,65,-125]</code>
GATE-R08-EAST-MAIN	<code>[8,65,-127]</code> , <code>[8,65,-126]</code> , <code>[8,65,-125]</code>

All six source guards include the complete:

- east property;
- north property;
- south property;
- waterlogged property;
- west property.

There are no material-only fence guards.

8.2 Runtime union guards

Vanilla neighbor physics changes the connection properties of the second and third fence cells as the first cells become air. Four operations therefore use a finite union of:

1. the exact immutable-snapshot state; and
2. the exact predicted state after the already-ordered neighbor removal.

The runner expands those four source groups to eight candidate `/fill` commands and requires exactly one successful alternative per source group in a strict live transaction.

8.3 Adjacent non-target fence cells

Two remaining fence cells react even though they are not direct targets.

Point	Snapshot exact state	Forward projected exact state	Rollback exact state
<code>[-8,65,-124]</code>	<code>birch_fence[east=false,north=true,south=true,waterlogged=false,west=false]</code>	<code>birch_fence[east=false,north=false,south=true,waterlogged=false,west=false]</code>	Snapshot state
<code>[8,65,-128]</code>	<code>birch_fence[east=false,north=true,south=true,waterlogged=false,west=false]</code>	<code>birch_fence[east=false,north=true,south=false,waterlogged=false,west=false]</code>	Snapshot state

They are modeled, not ignored. Vanilla neighbor physics changes them after the adjacent gate cell becomes air and restores them after the exact inverse puts the gate cells back.

8.4 Ordering proof

- stateful fence clearance executes first;
- curb and other reactive clearance executes before support/surface changes;

- foundations and surfaces execute afterward;
- sign structures execute last;
- reactive neighbor hazards: zero;
- all reactive operations before support mutations: true.

9. Protection proof

9.1 Zero-overlap results

Protected class	Overlap
Accepted R1 target union	0
Buildings	0
Rooms	0
Driveways	0
Landscapes	0
Accepted R1 garage bounds	0
Logs	0
Leaves	0
Existing block entities	0
Undeclared physical fence cells	0

9.2 Fence bounding-box interpretation

The database fence features use broad X/Z bounds that enclose whole neighborhoods. A literal bounding-box veto would classify every safe lawn, path, and house cell inside a neighborhood as occupied fence.

The package therefore records those coarse containments as expected false-positive enclosure relations and applies a stricter physical-cell rule:

- exact fence states are enumerated from the immutable snapshot;
- only six declared gate cells may be replaced;
- every other exact fence cell is protected;
- all reactive neighboring fence properties are modeled;
- the two new gate features are included in the database proposal.

9.3 Tree and authored-landscape avoidance

The original z=-124 study included a seven-block surface envelope. Survey found an oak canopy near x=-50..-46 on the north edge of one alternative. R08 is reduced to a three-wide shared surface and shifted so neither leaf nor log is targeted.

The central two-block offset also avoids the authored sea-lantern markers and quartz fence piers.

10. Wayfinding programme

10.1 Directory register

Feature	Point	Lines
R8-WF-R08-CENTRAL	[7,64, -132]	R08 CROSS-LINK / B03 NORTH / B02 VIA W ALLEY / C01 VIA E ALLEY
R8-WF-R08-WEST	[-63,64, -130]	WEST ALLEY / S R06 / B02 / N R07 / B03 / R08 / R01 >
R8-WF-R08-EAST	[63,64, -130]	EAST ALLEY / S R06 / C01 / N R07 / B03 / < R01 / R08
R8-WF-WESTLIGHT	[6,64, -223]	WESTLIGHT VENUE / N RAVENSREACH / THEN RAVENSGATE / W APPROACH RD

10.2 Venue naming decision

The directories do not use a generic STADIUM label for both venues.

- C01 remains C01 and routes south through the east network.
- WESTLIGHT VENUE is named explicitly.
- The Westlight sign states the actual regional chain: north to Ravensreach, then Ravensgate, then west on Approach Road.

This does not claim that R08 physically builds the regional Westlight road. It provides honest destination information at the relevant decision point.

11. Database feature proposal

No database mutation occurred.

Proposed external ID	Kind	Purpose
R8-R08-CROSS-LINK	road	Three-wide shared route and centerline

Proposed external ID	Kind	Purpose
R8-GATE-R08-WEST-MAIN	landmark	Declared west inner fence gate
R8-GATE-R08-EAST-MAIN	landmark	Declared east inner fence gate
R8-JCT-ALLEY-W-R08	landmark	West Alley endpoint
R8-JCT-R01-R08	landmark	R01 compact crossing
R8-JCT-R08-ALLEY-E	landmark	East Alley endpoint
R8-WF-R08-CENTRAL	landmark	Central district directory
R8-WF-R08-WEST	landmark	West Alley directory
R8-WF-R08-EAST	landmark	East Alley directory
R8-WF-WESTLIGHT	landmark	Regional Westlight directory

Checks:

- proposed rows: 10;
- unique external IDs: 10;
- existing database conflicts: 0;
- import performed: no.

12. Camera and screenshot evidence

12.1 Camera quality correction

The first visual pass rejected two images even though their pixel-content metrics were nonblank:

- the west-gate camera was inside or behind dark building geometry;
- the R01-junction camera was mostly occluded by a near wall.

The corrected contract moves:

- west gate to eye `[-18,78,-112]` , look `[-8,67,-126]` ;
- R01 junction to eye `[-1,76,-109]` , look `[0,67,-126]` ;
- east gate one clear bay to eye `[23,72,-137]` .

All seven perspective cameras now carry immutable-source:

- `3×3×3` eye-clearance samples;
- a 65-step center visibility ray;
- `eyeClear=true` ;

- `visibilityRay.unobstructed=true`.

The corrected west-gate and R01 views were separately visually accepted.

12.2 Authoritative provenance

Artifact	SHA-256
Corrected camera manifest	b86e37b3d4817b798b768053d517722eb92de3357792e4827393964432c76686
Authoritative capture report	09307c0a83f98430f52cf114a9ef9562d5bb7621380fd4db3a86d59dabce22a7
Capture report source-manifest binding	b86e37b3d4817b798b768053d517722eb92de3357792e4827393964432c76686

The earlier duplicate report was bound to manifest `7635f0...` and did not match the corrected PNG set. It is retained only as:

`data/exports/redevelopment-wave2-2026-07-28/mainstreet-r08/rejected-stale-capture-report-7635f0.json`

It is rejected evidence, not a PASS report. The only authoritative PASS report is:

`data/exports/redevelopment-wave2-2026-07-28/mainstreet-r08/before-capture-report.json`

12.3 Baseline image register

Camera	Bytes	SHA-256	Purpose

07-r08-directory.before.png	87,469	318c1e3844984d3768b92939d612dd98f4efeeb56b63fc784303a4228b074155	Central directory object location

Camera	Bytes	SHA-256	Purpose
08-westlight-directory.before.png	102,485	6e454e287b55b889e3fd48de20b5c681a0ecddc dc9d07ed42866c1dba9d98506	Regional directory object location

All eight pass nonblank image checks and are bound to the immutable source snapshot.

13. Guard, parser, rollback, and test evidence

13.1 Exact preflight

Command:

```
node scripts/preflight_guarded_ops.mjs \  
  data/buildops/mainstreet-wave2-r08-2026-07-28.txt \  
  --regions data/worldsnap-wave2-baseline-4fca1ff3-20260728/region \  
  --report data/buildops/mainstreet-wave2-r08-2026-07-28.preflight.json
```

Result:

- operation groups checked: 736;
- passed: 736;
- failed: 0;
- partial masks: 0.

13.2 Forward parser dry-run

Command:

```
python3 scripts/rcon_runner.py \  
  data/buildops/mainstreet-wave2-r08-2026-07-28.txt \  
  --dry-run --strict-noop \  
  --report data/buildops/mainstreet-wave2-r08-2026-07-28.forward-dry-run.json
```

Result:

- source operations: 740;
- source groups: 740;
- expanded commands: 744;
- finite-union groups: 4;
- WorldEdit leftovers: 0.

13.3 Rollback parser dry-run

Command:

```
python3 scripts/rcon_runner.py \  
  data/buildops/mainstreet-wave2-r08-2026-07-28.rollback.txt \  
  --dry-run --strict-noop \  
  --report data/buildops/mainstreet-wave2-r08-2026-07-28.rollback-dry-run.json
```

Result:

- source operations: 736;
- expanded commands: 736;
- WorldEdit leftovers: 0.

13.4 Independent QA

Command:

```
node scripts/qa_mainstreet_wave2_r08.mjs
```

Result:

- checks: 32;
- passed: 32;
- failed: 0;
- decision: `PASS_OFFLINE_ONLY`.

13.5 Focused tests

Command:

```
npx vitest run test/build/generateMainstreetWave2R08.test.ts
```

Result:

- files: 1 passed;
- tests: 8 passed;
- failed: 0.

Machine-readable test output:

```
data/world-review/mainstreet-wave2-r08-focused-tests-2026-07-28.json
```

13.6 Backend build

Command:

```
npm run build
```

Result: TypeScript compilation passed.

14. Exact rollback contract

The rollback contains 736 operations in strict reverse order.

For each forward operation:

- rollback coordinates equal forward coordinates;
- rollback expected state equals the forward replacement;
- rollback replacement equals the first exact immutable-snapshot source state;
- directory signs are removed by the inverse sign-block replacement, so their block entities are removed with the blocks;
- restored gate cells cause the two modeled adjacent fence cells to reconnect through vanilla neighbor physics.

The rollback is valid only after the exact complete forward package. It must not be applied to a partially executed package or a differently regenerated package.

15. Future live release runbook

This section is a future operator contract, not permission to execute now.

1. Stop or coordinate every other active builder in the R08 and camera envelopes.
2. Save the world.
3. Copy the relevant Anvil region files to a new immutable snapshot directory.
4. Hash that directory.
5. Update the plan only if the new hash intentionally supersedes this baseline.
6. Regenerate forward, rollback, report, design, and camera manifest.
7. Run the exact guard preflight against that same immutable directory.
8. Confirm zero protected overlaps, zero new block entities, and the same six declared gate cells.
9. Perform a live entity-clear sweep over all operation chunks.
10. Render or capture the same-camera before set from the live release baseline.
11. Execute the entire forward package as one strict transaction.
12. Fail closed on any zero-match, multi-match, unknown response, or partial group.
13. Walk west→east.

14. Walk east→west.
15. Walk R01 north→south across the new crossing.
16. Walk R01 south→north across the new crossing.
17. Walk from each new endpoint onto its existing alley.
18. Read and verify all four directory signs in world.
19. Verify both remaining reactive fence ends have the predicted disconnected property.
20. Capture all eight after images with unchanged camera geometry.
21. Refresh the world catalog and object/media crosswalk.
22. Import the ten database feature proposals only after physical acceptance.
23. If any required check fails, stop and choose between exact rollback or a new reviewed forward repair; do not improvise an unguarded partial fix.

16. Deferred MainStreet work

R08 is not presented as the final MainStreet master plan.

16.1 Full outer-street connection

The next grid study can evaluate whether R08 should eventually extend from the rear alleys to R02 and R03. That work must separately solve:

- outer fence gates;
- B02's close east edge;
- R02/R03 curb geometry;
- property/frontage hierarchy;
- safe camera and sightline positions;
- whether an outer connection would become unwanted fast through traffic.

16.2 R02 widening

Continue as a measured study only. A future package needs exact collision and grade sections, not a blanket two-block expansion.

16.3 B02

B02 should remain in place unless a complete relocation model proves:

- better road and loading access;
- no loss of authored rooms;
- a valid rollback or rebuild strategy;
- database parent and geometry migration;
- better media/readability at eye level.

16.4 B03

B03's R07/service identity was improved in R1. A later wave should judge it against visitor approach cameras and determine whether frontage or landmark work is still needed before considering movement.

16.5 C01 and Westlight

R08 fixes naming and decision information; it does not solve the full regional venue journey. The later regional phase should audit:

- continuous MainStreet → Ravensreach route identity;
- Ravensreach → Ravensgate transition;
- Ravensgate → Approach Road junction;
- Approach Road → Westlight entrance;
- Westlight entrance, concourse, seating, and screen sightlines;
- C01 Training Arena identity as a separate destination.

Authoritative baseline screenshots	Eight
Independent QA	32/32 PASS
Focused tests	8/8 PASS
Build	PASS
Live execution	Not authorized / not performed

The correct programme state is:

OFFLINE ENGINEERING GO – LIVE EXECUTION NOT AUTHORIZED

Wave 2 Decision and Rejection Log

Program: REDEV-2026-07-28-R2

Purpose: retain alternatives, defects, and failed evidence instead of silently overwriting them.

D-01 — Raven Rock T2b extent

Measured condition

T2b loses route identity inside a large natural cavern. A candidate tunnel-within-cavern section was measured at x=-145 through x=-135.

The immutable Wave 2 baseline contains an active water column at and beyond the east end of that study:

- x=-135/-134;
- z=177..179;
- y=1..9.

Rejected alternative

Extend the dry liner through x=-135.

Rejected because the terminal shell would become fluid-adjacent. A visually larger pilot did not justify introducing a wet-threshold failure mode into a dry, additive package.

Selected decision

INF-RR-02 ends at x=-136. It contains ten measured stations, 151 exact addition-only targets, no excavation, and no target that is fluid or face-adjacent to a fluid/gravity/waterlogged hazard. The aquifer remains visible in the buffer census and becomes a hard pre-release stop condition if it advances.

D-02 — MainStreet R08 first width

Measured condition

R06 to R07 is approximately 135 blocks without an intermediate public cross connection. This exceeds the 100-block project target and contributes to the user's “turn a corner and have no idea what you are looking at” experience.

Rejected alternative

Build R08 continuously from x=-80 through x=80 at z approximately -127..-121.

Rejected after coordinate audit because its edge treatment entered the real neighborhood fence at x=-80 and x=80. A road diagram that silently deletes a perimeter is not a valid connected-grid solution.

Revised candidate

The current candidate connects the two accepted R1 alleys through R01 and uses six deliberately designed gate cells at the exact inner fence crossings. Coarse registered fence bounding boxes cover entire neighborhood districts and are retained as a database-warning overlap; they are not treated as if every cell inside the rectangle were a fence block.

Acceptance still requires:

- zero target intersections with buildings, rooms, garages, and protected landscape;
- exact enumeration of the six physical gate cells;
- enumeration of every adjacent fence whose connection properties change;
- complete pre/post/rollback fence states;
- no material-only fence source guard;
- a registered gate feature and matched evidence.

D-03 — Screenshot byte count is not image quality

Rejected evidence

Initial automatic exact-object captures produced:

Object	Failure
H09 / The Casa Lana	Entire frame was uniform gray; the small overlay was the only content
C02 / West Garden Villa	Principal object was heavily occluded by foreground leaves

Object	Failure
H01 / The Alexandria	First view filled the frame with an uninformative rear/blank gable
RR-B1 / Command Operations Center	Anonymous dim corridor and blank walls did not establish the named building
T2b section camera	Near wall/floor plane occluded the lower frame; the revised attempt became fully uniform

All were rejected even though the files existed and most exceeded the former 8,000-byte threshold.

Selected control

`render_redevelopment_camera_manifest.mjs` now records sampled luminance and quantized-color metrics and fails a blank/low-information image. The media workstream must additionally review frontage, target visibility, foreground occlusion, and whether a named underground building is represented by a recognizable entrance, principal room, or useful sectional context.

Distinct hashes prove files differ; they do not prove the subject is visible.

D-04 — Material-only fence guards

The new generic manifest QA was run retrospectively against the accepted R1 package set. It confirmed:

- 36,781 total target cells;
- zero cross-package target intersections;
- four packages meeting the new strict structural rule.

It also identified five Phase 1 gate cells grouped under two `minecraft:birch_fence` source masks that did not enumerate connection and waterlogged properties. R1 executed successfully and its exact rollback postflight passed; this is not a claim that the accepted world is currently wrong. It is a retrospective process finding: a material-only source mask can accept multiple neighbor-dependent states and therefore does not meet the stricter Wave 2 exact-state definition.

Wave 2 does not repeat that exception. Any R08 fence gate must use complete source properties or an explicitly enumerated finite exact-state union, with exactly one alternative allowed to match.

Evidence:

- `data/buildops/redevelopment-r1-release-manifest.json`
- `data/world-review/redevelopment-r1-release-manifest-retrospective-qa.json`
- `scripts/qa_guarded_release_manifest.mjs`

D-05 — Release composition

The Wave 2 transaction is manifest-driven. Passing one candidate does not grant authority to a weaker candidate.

Current integration state:

Package	State
INF-RR-02 T2b dry liner	Offline structural and focused QA pass; corrected camera contract pending
MainStreet R08	Revised candidate engineering; exact neighbor-fence audit pending
C01 plan/media expansion	Offline generation and visual QA in progress

The final manifest contains only packages that independently pass and have zero mutual target intersections.

Wave 2 Redevelopment Artifact Register

Release: REDEV-2026-07-28-R2
Generated: 2026-07-28T02:43:39.166Z
Machine register: data/world-review/redevelopment-artifact-manifest-2026-07-28-wave2.json

Purpose and reading rule

This is the human review index for the release evidence set. The adjacent JSON is authoritative for file-level SHA-256 values, byte sizes, image dimensions, JSON status fields, package IDs, operation hashes, and snapshot bindings. Generated dossier outputs are intentionally excluded to avoid a self-referential hash cycle.

Integrity procedure

1. Regenerate this register only after all release evidence is final.
2. Compare the JSON artifact path set to the distributed handoff.
3. Recompute SHA-256 over exact bytes and compare every record.
4. Verify every post-release JSON snapshot binding resolves to the accepted immutable post-release region directory.
5. Treat an absent file, hash mismatch, parse error, stale snapshot binding, or non-passing acceptance status as a documentation defect.
